

HIVENT

Simple, Economical, Effective Odor Control

HIVENT Passive Vapor Phase Odor Neutralization Advantages

- **HIVENT** is a passive vapor phase odor control device that uses **NO WATER OR ELECTRICITY**. **HIVENT** utilizes the pumping cycles of the lift station to draw **HISCENT** odor neutralizer into the station and then neutralizes the discharge air when the station is filling. During low flows, the **HISCENT** is also distributed in the area by natural air movement.
- **HIVENT** produces no backpressure on the station like carbon vent filter units, thus allowing the escaping air to go through the **HIVENT** and not around the lift station covers untreated.
- **HIVENT** uses **HISCENT** odor neutralizers that are environmentally safe, all-natural plant extracts with **NO HARSH CHEMICALS**.
- **HIVENT** typically uses around 5 gallons per year of **HISCENT** depending on odor concentrations.
- **HIVENT** has **NO MAINTENANCE** since there are no moving parts.

HISCENT odor neutralizer is the reactive component of the **HIVENT** system. The **HISCENT** line of odor neutralizers are a safe blend of all-natural plant extracts formulated with water-based surfactants to neutralize a wide range of malodors. **HISCENT** bonds with odorous compounds to neutralize them economically and effectively. **HIVENT** is fabricated from corrosion resistant aluminum and is engineered to neutralize low air volumes using internal contact times and natural heat to effectively vaporize the **HISCENT** odor neutralizer. The vaporized **HISCENT** odor neutralizer is either pulled into the station or discharged through the side vents during the filling/pumping cycles.
