

HIBOCS

Simple, Economical, Effective Odor Control

HIBOCS Biotrickling Filter Advantages

The **HIBOCS** is a biotrickling filter odor control system designed to remove vapor phase odorous gases, primarily hydrogen sulfide (H₂S). Typical applications are lift stations or plant headworks. The vessels are fabricated from fiberglass and contain a non-compactable, high surface area synthetic media. The **HIBOCS** control panel, recirculation pump, and nutrient tank are mounted on an engineered skid for easy installation by your staff. The system includes a corrosion-resistant cast aluminum or fiberglass blower powered by a long-life stainless-steel wash-down/inverter duty motor controlled by a VFD for quiet operation. **HIBOCS** offers a "Dual Mode" operation capable of operating on either freshwater for total odor control or recirculated water for H₂S control at the flip of a switch. All **HIBOCS** systems use nonproprietary nutrients keeping the operating cost very low. Our exclusive 3-year system warranty and a 10-year non-prorated media warranty offers peace of mind.
